

WATER CRISIS ASSESSMENT

Household Emergency Situation Report

Location: **Chennai****CRITICAL**Report Date: **04 May 2026**

DAYS REMAINING

8

days of supply left

STORAGE LEFT

22%

176L of 800L

DAILY USAGE

68L

for 4 people

PREP SCORE

38

/100 preparedness

SITUATION SUMMARY: CRITICAL: Days from running dry. Emergency measures must be activated now. Monte Carlo modelling projects a median of **9 days** (50% confidence: 7–11 days). At current usage of **68.0L/day**, supplies are projected to reach zero around **12 May 2026**.

HOUSEHOLD	2 adults, 2 childs	RATIONING	Mild
LIVE TEMP	36.2°C (live)	SURVIVAL FLOOR	12.0L/day minimum

SUPPLY ANALYSIS & PROJECTIONS

Current Water Storage

12 May 2026

DAYS REMAINING

8

If usage remains at 68L/day with no changes

Monte Carlo Probability Analysis (300 simulations)

Percentile	Days Remaining	Depletion Date	Interpretation
5th (Worst case)	5 days	09 May	Critical — plan for this
25th (Likely low)	7 days	11 May	Conservative estimate
50th (Median)	9 days	13 May	Most probable outcome
75th (Likely high)	11 days	15 May	Optimistic estimate
95th (Best case)	14 days	18 May	Best-case scenario

Statistical uncertainty: std deviation = 2.3 days. There is a **50% probability** the supply will last between **7** and **11 days**.

HEALTH RISK ASSESSMENT

Current Health Indicators

SURVIVAL FLOOR

12.0L/day

total

(3.0L per person/day minimum for survival)

Projected Health Impact if No Action Taken

Days from Now	Anticipated Health Impact	Risk Level
Day 1–3	Mild thirst, reduced urine output, early fatigue	LOW
Day 3–7	Moderate dehydration, hygiene deterioration, gastrointestinal risk	MODERATE
Day 7–14	Significant health stress, skin/urinary infections, cognitive impairment	HIGH
Day 14–21	Severe dehydration risk, high illness probability, hospital-level care needed	SEVERE
Day 21+	Critical survival threshold — life-threatening without external water supply	CRITICAL

STRATEGY COMPARISON & RECOMMENDATIONS

Rationing Strategy Impact

Strategy	Days of Supply	Visual (relative)	Depletion Date
No Change Continue current usage — fastest depletion	8 days		12 May
Mild Rationing ~25% reduction — small sacrifices, meaningful gain	13 days		17 May
Moderate ~45% reduction — significant but manageable	19 days		23 May
Severe Rationing ~60% reduction — survival mode, maximum extension	27 days		31 May

RECOMMENDATION: Switch to **Mild Rationing** rationing immediately to significantly extend your supply window.

Emergency Action Plan

- 1. Activate severe rationing — toilet flushing with greywater only
- 2. Call CMWSSB / municipal water helpline immediately
- 3. Emergency tanker booking required today
- 4. Move to 3L/person/day strict survival protocol

Available Alternative Water Sources

Source	Volume	Cost	Quality	Notes
Water Tanker	1000L	Rs.600	Utility	2h delivery, price spikes in crisis
20L RO Bottle	20L	Rs.32	Potable	Available at 3 shops nearby

CONSUMPTION ANALYSIS

Daily Water Usage Breakdown

Category	Litres/Day	Share	Visual
Drinking	8.0L	12%	
Cooking	10.0L	15%	
Bathing/Hygiene	18.0L	26%	
Toilet	14.0L	21%	
Handwashing	6.0L	9%	
Laundry	8.0L	12%	
Vessel Washing	4.0L	6%	
TOTAL	68.0L	100%	

Per-person average: 17.0L/day. Survival minimum is 12.0L/day total. Current usage is 567% of survival floor.

7-Day Temperature Forecast (Open-Meteo)

Day 1	Day 2	Day 3	Day 4	Day 5	Day 6	Day 7
36°C	37°C	38°C	36°C	35°C	37°C	39°C

High temperatures increase water consumption by ~0.5L/person/°C above 25°C.

This report was generated by Day Zero Water Emergency Planner on 04 May 2026. Projections are based on Monte Carlo simulation (300 runs) and may vary with actual usage patterns, unexpected supply events, or rainfall. This report is intended for household emergency planning purposes only.
